(54) Title: COAGULATION TESTS AT AMBIENT TEMPERATURE

(57) Abstract: A method of determining prothrombin time (PT) in a whole blood, anti-coagulated blood, blood plasma or anti-coagulated blood plasma sample at an ambient temperature in the range of 15°C to 45°C is described. The method is performed with liquid reagents and the PT, preferably expressed as International Normalized Ratio (INR), is calculated based on said temperature and the clotting time (CT). A test kit is also described for analysis of PT which comprises temperature recoding means, and one or more defined volumes of whole blood, anti-coagulated blood, blood plasma or anti-coagulated blood plasma sample, and optionally time registration means and volume determining means.
